OpenNRE: An Open and Extensible Toolkit for Neural Relation Extraction

Xu Han, Tianyu Gao, Yuan Yao, Demin Ye, Zhiyuan Liu, Maosong Sun

October 2020

Xu Han, Tianyu Gao, Yuan Yao, Demin Ye, <mark>Z</mark>OpenNRE: An Open and Extensible Toolkit fe

OpenNRE is an open-source and extensible toolkit that provides a unified framework to implement neural models for relation extraction (RE).

OpenNRE provides various functional RE modules based on both TensorFlow and PyTorch to maintain sufficient modularity and extensibility, making it becomes easy to incorporate new models into the framework.

Application Scenarios

- sentence-level RE;
- bag-level RE;
- document-level RE;
- few-shot RE.

Figure 1: The examples of all application scenarios in OpenNRE.

Toolkit Design and Implementation

Xu Han, Tianyu Gao, Yuan Yao, Demin Ye, Z<mark>OpenNRE: An Open and Extensible Toolkit f</mark>e

A D N A B N A B N A B N

Experiment and Evaluation

Two datasets of sentence-level RE were used: SemEval 2010 Task-8 and Wiki80.

Model	Wiki80	SemEval
CNN BERT BERT-Entity	$\begin{array}{c} 63.93 \\ 84.57 \\ 86.61 \end{array}$	$71.11 \\ 84.02 \\ 84.21$

Table 1: Accuracies of various models on Wiki80 and SemEval 2010 Task-8 under the single sentence setting.

Model	F1	F1 (*)
BERT BERT-Entity	$ \begin{array}{c c} 0.880 \\ 0.883 \end{array} $	0.892

Table 2: Micro F1 scores of various models on SemEval 2010 Task-8 under the sentence-level RE setting. "(*)" indicates the original results from Soares et al. (2019).

"BERT" refers to using entity markers in input and taking [CLS] as output. "BERT-Entity" refers to using entity markers in input and taking entity start as output.

Xu Han, Tianyu Gao, Yuan Yao, Demin Ye, <mark>Z</mark>OpenNRE: An Open and Extensible Toolkit fe

October 2020 5 / 11

Implementation

Clone the git repository, install and upload the library OpenNRE

- [1] !git clone https://github.com/thunlp/OpenNRE.git
- [2] from google.colab import drive drive.mount('/content/drive/', force_remount=True)
- [3] %cd '/content/OpenNRE'
 !pip install -r requirements.txt
- [4] !python setup.py install
- [5] import opennre

Implementation

Select model and upload it

- wiki80_cnn_softmax: trained on wiki80 dataset with a CNN encoder.
- · wiki80_bert_softmax: trained on wiki80 dataset with a BERT encoder.
- wiki80_bertentity_softmax: trained on wiki80 dataset with a BERT encoder (using entity representation concatenation).
- · tacred_bert_softmax: trained on TACRED dataset with a BERT encoder.
- tacred_bertentity_softmax: trained on TACRED dataset with a BERT encoder (using entity representation concatenation).

```
[6] model = opennre.get_model('wiki80_cnn_softmax')
```

[→ 2020-10-13 05:58:24,490 - root - INFO - Initializing word embedding with word2vec.

You can do relation extraction with the following format:

```
[7] model.infer({'text': 'He was the son of Máel Dúin mac Máele Fithrich, and grandson of the high king Áed Uaridnach (died 612)
'h': {'pos': (18, 46)}, 't': {'pos': (78, 91)})
```

イロト イポト イヨト イヨト

October 2020

7/11

```
□ ('father', 0.7500484585762024)
```

The infer function takes one dict as input. The text key represents the sentence and h / t keys represent head and tail entities, in which pos (position) should be specified.

The model will return the predicted result as: ('father', 0.7500484585762024)

I upload and tested other models

[8] model1 = opennre.get model('wiki80 bert softmax')

[9] model2 = opennre.get model('wiki80 bertentity softmax')

[10] model3 = opennre.get model('tacred bert softmax')

[11] model4 = opennre.get model('tacred bertentity softmax')
